HARMONIZED CLAIM SET

(with parenthetical status indicators relating to the most recent prior Reissue claims)

1. (Original) An electrochemical gas sensor for quantitative measurement of a gas in a

ambient atmosphere comprising:

a sensing electrode permeable to water vapor and comprised of an electrical

conducting material and having a surface exposed to the ambient atmosphere;

a counter electrode permeable to water vapor and comprised of an electrical

conducting material;

a first protonic conductive electrolyte membrane permeable to water vapor and

situated between and in contact with the sensing and counter electrodes, the sensing

electrode reacting with the gas to produce a change in electrical characteristic between

the sensing electrode and the counter electrode;

means for electrical measurement electrically connected to said sensing and

counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter

electrode to said water vapor, wherein the electrical conducting material of at least one of

said sensing and counter electrodes is a proton-electron mixed conductive material

having 10-50 wt % of a proton conductor material and 50-90 wt % of a first and a second

electrical conductor material; whereby, in a positive ambient atmosphere concentration of

said gas, said electrical measurement means detects changes in said electrical

characteristic.

2. (Original) The electrochemical gas sensor as defined in claim 1, wherein said water

vapor containing means contains a volume of water and an antifreeze additive.

3. (Original) The electrochemical gas sensor as defined in claim 1, wherein the surface of

said sensing electrode that is exposed to the ambient atmosphere has a surface area that is

smaller than the surface area of the surface of the counter electrode that is exposed to said

water vapor, whereby the first protonic conductive electrolyte membrane is exposed to

Response to Office Action USSN 10/621,637 & 90/006,209 Page 8 of 68

substantially 100 percent relative humidity, and a positive pressure of said water vapor

exists from the surface of said counter electrode exposed to said water vapor to the

surface of said sensing electrode exposed to the ambient atmosphere.

4. (Original) The electrochemical gas sensor as defined in claim 3, wherein the surface

area of the surface of the counter electrode that is exposed to said water vapor is

separated from said means for exposing a surface of said counter electrode to said water

vapor by a hydrophobic membrane permeable to water vapor and substantially

impervious to water.

5. (Original) The electrochemical gas sensor as defined in claim 1, wherein the first

protonic conductive electrolyte membrane has opposing surfaces, each of said opposing

surfaces being in contact with one of the sensing and counter electrodes, wherein at least

one of the opposing surfaces of said first protonic conductive electrolyte membrane in

contact with one of the sensing and counter electrodes is substantially nonplanar.

6. (Original) The electrochemical gas sensor as defined in claim 1, wherein at least one of

the sensing and counter electrodes is comprised of film having a thickness in the range of

about 50 Angstroms to 10,000 Angstroms.

7. (Original) The electrochemical gas sensor as defined in claim 6, wherein the film is

substantially composed of a noble metal.

8. (Original) The electrochemical gas sensor as defined in claim 7, wherein the noble

metal is platinum.

9. (Original) The electrochemical gas sensor as defined in claim 1, wherein the first

protonic conductive electrolyte membrane is substantially composed of a solid,

perfluorinated, ion-exchange polymer.

10. (Original) The electrochemical gas sensor as defined in claim 1, wherein the first

Response to Office Action USSN 10/621,637 & 90/006,209

protonic conductive electrolyte membrane is a hydrated metal oxide protonic conductor

electrolyte membrane.

11. (Original) The electrochemical gas sensor as defined in claim 1, wherein the proton

conductor material for said at least one of the sensing and counter electrodes is a

copolymer having a tetrafluoroethylene backbone with a side chain of perfluorinated

monomers containing at least one of a sulfonic acid group or a carboxylic acid group.

12. (Original) The electrochemical gas sensor as defined in claim 1, wherein one of the

first and second electrical conductor materials for said at least one of the sensing and

counter electrodes is about 50-99 wt % of carbon black, and the other of the first and

second electrical conductor materials for said at least one of the sensing and counter

electrodes is about 1-50 wt % of platinum.

13. (Original) The electrochemical gas sensor as defined in claim 1, wherein one of the

first and second electrical conductor materials for said at least one of the sensing and

counter electrodes is about 50-99 wt % of carbon black, and the other of the first and

second electrical conductor materials for said at least one of the sensing and counter

electrodes is about 1-50 wt % of Ru oxide.

14. (Original) The electrochemical gas sensor as defined in claim 1, wherein the

electrochemical gas sensor further comprises:

first and second pump electrodes comprised of an electrical conducting material

permeable to water vapor, separate from said sensing and counter electrodes, and situated

on opposite sides of and in contact with said first protonic conductive electrolyte

membrane, said second pump electrode being situated on the same side of said first

protonic conductive membrane as the counter electrode and having a surface thereon

exposed to the water vapor in said means for exposing a surface of said counter electrode

to said water vapor; and

means for applying a DC power across the first protonic conductive electrolyte

membrane, said first and second pump electrodes having in electrical connection

Response to Office Action USSN 10/621,637 & 90/006,209 Page 10 of 68

therebetween said means for applying DC power across the first protonic conductive

electrolyte membrane;

whereby the gas is transported away from the counter electrode when the DC

power means applies a DC power to the first and second pump electrodes.

15. (Original) The electrochemical gas sensor of claim 14, wherein the electrical

conducting material of the first and second pump electrodes is substantially composed of

carbon.

16. (Original) The electrochemical gas sensor as defined in claim 14, wherein the

electrical conducting material of the first and second pump electrodes is substantially

composed of noble metals.

17. (Original) The electrochemical gas sensor as defined in claim 14, wherein the

electrical conducting material of the first and second pump electrodes is substantially

composed of conductive hydrated metal oxides.

18. (Original) The electrochemical gas sensor as defined in claim 14, wherein at least one

of the first and second pump electrodes is comprised of a film having a thickness in the

range of about 50 Angstroms to 10,000 Angstroms.

19. (Original) The electrochemical gas sensor as defined in claim 14, wherein the

electrical conducting material of said first and second pump electrodes is a proton-

electron mixed conductive material having 10-50 wt % of a proton conductor material

and 50-90 wt % of a first and a second electrical conductor material.

20. (Original) The electrochemical gas sensor as defined in claim 19, wherein the proton

conductor material for both the first and second pump electrodes is a copolymer having a

tetrafluoroethylene backbone with a side chain of perfluorinated monomers containing at

least one of a sulfonic acid group or a carboxylic acid group.

Response to Office Action USSN 10/621,637 & 90/006,209 Page 11 of 68

21. (Original) The electrochemical gas sensor as defined in claim 19, wherein one of the

first and second electrical conductor materials for the first pump electrode is about 50-99

wt % of carbon black, and the other of the first and second electrical conductor materials

for the first pump electrode is 1 to 50 wt % of platinum.

22. (Original) The electrochemical gas sensor as defined in claim 19, wherein one of the

first and second electrical conductor materials for the second pump electrode is about 50-

99 wt % of carbon black, and the other of the first and second electrical conductor

materials for the second pump electrode is 1 to 50 wt % of Ru oxide.

23. (Original) The electrochemical gas sensor as defined in claim 1, wherein the

electrochemical gas sensor further comprises:

a second protonic conductive electrolyte membrane permeable to water vapor;

first and second pump electrodes permeable to water vapor and comprised of an

electron conductive material, and being separate from said sensing and counter electrodes

and situated on opposite sides of and in contact with said second protonic conductive

electrolyte membrane, said means for exposing a surface of said counter electrode to said

water vapor exposing a surface of said second pump electrode to said water vapor, and

said first pump electrode having a surface exposed to the ambient atmosphere; and

means for applying a DC power across said second protonic electrolyte

membrane, said first and second pump electrodes having in electrical connection

therebetween said means for applying DC power across said second protonic electrolyte

membrane;

whereby the gas is transported away from the counter electrode when the DC power

means applies a DC power to the first and second pump electrodes.

24. (Original) The electrochemical gas sensor as defined in claim 23, wherein the second

protonic conductive electrolyte membrane is substantially composed of a solid,

perfluorinated, ion-exchange polymer.

Response to Office Action USSN 10/621,637 & 90/006,209 Page 12 of 68

25. (Original) The electrochemical gas sensor as defined in claim 23, wherein the second

protonic conductive electrolyte membrane is a hydrated metal oxide protonic conductor

electrolyte membrane.

26. (Original) The electrochemical gas sensor as defined in claim 23, wherein the surface

area of the surface of said first pump electrode that is exposed to the ambient atmosphere

is smaller than the surface area of the surface of the second pump electrode that is

exposed to said water vapor, whereby the second protonic conductive electrolyte

membrane is exposed to substantially 100 percent relative humidity, and a positive

pressure of said water vapor exists from the surface of said second pump electrode that is

exposed to said water vapor to the surface of said first pump electrode that is exposed to

the ambient atmosphere.

27. (Original) The electrochemical gas sensor as defined in claim 26, wherein the surface

area of the surface of the second pump electrode that is exposed to said water vapor is

separated from said means for exposing a surface of said counter electrode to said water

vapor by a hydrophobic membrane permeable to water vapor and substantially

impervious to water.

28. (Original) The electrochemical gas sensor as defined in claim 1, further comprising:

means for applying a DC pulse power source across the first protonic conductive

membrane, said sensing and counter electrodes having in electrical connection

therebetween said means for applying DC pulse power across the first protonic

conductive membrane; and

switch means for alternating the connection between the sensing and counter

electrodes from the electrical measurement means to the DC pulse power means;

whereby, in a positive ambient atmosphere concentration of said gas, said electrical

measurement means detects changes in said electrical characteristic when said switch

means connects said electrical measurement means to the sensing and counter electrodes;

and

Response to Office Action USSN 10/621,637 & 90/006,209 Page 13 of 68

whereby said DC pulse power means moves the gas away from a side of the gas sensor

where the counter electrode is placed when said switch means connects said DC pulse

power means to the sensing and counter electrodes.

29. (Original) The electrochemical gas sensor as defined in claim 1, wherein the gas is

CO.

30. (Original) The electrochemical gas sensor as defined in claim 1, wherein the gas is

 $NO_x$ .

31. (Original) The electrochemical gas sensor as defined in claim 1, wherein the gas is

hydrogen.

32. (Original) The electrochemical gas sensor as defined in claim 1, wherein the gas is

 $H_2S$ .

33. (Original) The electrochemical gas sensor as defined in claim 1, wherein the gas is

H<sub>2</sub>O vapor.

34. (Original) The electrochemical gas sensor as defined in claim 1, wherein the gas is

alcohol vapor.

35. (Original) An electrochemical gas sensor for quantitative measurement of a

gas in an ambient atmosphere comprising:

a sensing electrode permeable to water vapor and comprised of an electrical

conducting material and having a surface exposed to the ambient atmosphere;

a counter electrode permeable to water vapor and comprised of an electrical

conducting material;

a first protonic conductive electrolyte membrane permeable to water vapor and

situated in between and in contact with the sensing and counter electrodes, the sensing

electrode reacting with the gas to produce a change in electrical characteristic between

the sensing electrode and the counter electrode;

a second protonic conductive electrolyte membrane permeable to water vapor;

first and second pump electrodes permeable to water vapor and comprised of an

electrical conductive material, and being separate from said sensing and counter

electrodes and situated on opposite sides of and in contact with said second protonic

conductive electrolyte membrane;

means, containing a volume of water vapor, for exposing a surface of said second

pump electrode to said water vapor, and said first pump electrode having a surface

exposed to the ambient atmosphere, said second pump electrode being separated from

said counter electrode by said means for exposing a surface of said second pump

electrode to said water vapor, and said counter electrode having a surface exposed to said

water vapor by said means for exposing a surface of said second pump electrode to said

water vapor;

means for electrical measurement in electrical communication with said sensing

electrode and said counter electrode; and

means for applying a DC power across said second protonic electrolyte membrane

in electrical contact with said first and second pump electrodes;

whereby the gas is transported away from the counter electrode when the DC power

means applies a DC power across said second protonic electrolyte membrane; and

whereby, in a positive ambient concentration of said gas, said electrical measurement

means detects changes in said electrical characteristic.

36. (Original) The electrochemical gas sensor as defined in claim 35, wherein at least one

of said first and second protonic conductive electrolyte membranes is substantially

comprised of a solid, perfluorinated, ion-exchange polymer.

37. (Original) The electrochemical gas sensor as defined in claim 35, wherein at least one

of the first and second protonic conductive electrolyte membranes is a hydrated metal

oxide protonic conductor electrolyte membrane.

38. (Original) The electrochemical gas sensor as defined in claim 35, wherein the surface

of said first pump electrode that is exposed to the ambient atmosphere has a surface area

smaller than the surface area of the surface of the second pump electrode that is exposed

to said water vapor, and wherein the surface of said sensing electrode that is exposed to

the ambient atmosphere has a surface area smaller than the surface area of the surface of

the counter electrode that is exposed to said water vapor, whereby the first protonic

conductive electrolyte membrane is exposed to substantially 100 percent relative

humidity, a positive pressure of said water vapor exists from the surface of said counter

electrode that is exposed to said water vapor to the surface of said sensing electrode that

is exposed to the ambient atmosphere, the second protonic conductive electrolyte

membrane is exposed to substantially 100 percent relative humidity, and a positive

pressure of said water vapor exists from the surface of said second pump electrode that is

exposed to said water vapor to the surface of said first pump electrode that is exposed to

the ambient atmosphere.

39. (Original) The electrochemical gas sensor as defined in claim 38, wherein the surface

area of each of the surfaces of the second pump and counter electrodes that are exposed

to said water vapor by said means for exposing a surface of said second pump electrode

to said water vapor are each separated from said means for exposing a surface of said

second pump electrode to said water vapor by a hydrophobic membrane permeable to

water vapor and substantially impervious to water.

Response to Office Action USSN 10/621,637 & 90/006,209 Page 16 of 68

40. (Original) The electrochemical gas sensor as defined in claim 35, wherein said means

for exposing a surface of said second pump electrode to said water vapor further contains

an antifreeze additive.

41. (Original) The electrochemical gas sensor as defined in claim 35, wherein at least one

of the surfaces of said first protonic conductive electrolyte membrane in contact with one

of the sensing and counter electrodes is substantially nonplanar, and wherein at least one

of the surfaces of said second protonic conductive electrolyte membrane in contact with

one of the first and second pump electrodes is substantially nonplanar.

42. (Original) The electrochemical gas sensor as defined in claim 35, wherein at least one

of the sensing, counter, first pump, and second pump electrodes is comprised of film

having a thickness in the range of about 50 Angstroms to 10,000 Angstroms.

43. (Original) The electrochemical gas sensor as defined in claim 42, wherein the film is

substantially composed of a noble metal.

44. (Original) The electrochemical gas sensor as defined in claim 43, wherein the noble

metal is platinum.

45. (Original) The electrochemical gas sensor as defined in claim 35, wherein the at least

one of the sensing, counter, first pump, and second pump electrodes is substantially

comprised of proton conductive material.

46. (Original) The electrochemical gas sensor as defined in claim 35, wherein at least one

of the first and second protonic conductive electrolyte membranes is substantially

comprised of a solid, perfluorinated, ion-exchange polymer.

47. (Original) The electrochemical gas sensor as defined in claim 35, wherein at least one

Response to Office Action USSN 10/621,637 & 90/006,209 Page 17 of 68

of the first and second protonic conductive electrolyte membranes is a hydrated metal

oxide protonic conductive electrolyte membrane.

48. (Original) The electrochemical gas sensor as defined in claim 35, wherein the

electrical conducting material of at least one of said sensing, counter, first pump, and

second pump electrodes is a proton-electron mixed conductive material having 10-50 wt

% of a proton conductor material and 50-90 wt % of a first and a second electrical

conductor material.

49. (Original) The electrochemical gas sensor as defined in claim 48, wherein the proton

conductor material for said at least one of the sensing, counter, first pump, and second

pump electrodes is a copolymer having a tetrafluoroethylene backbone with a side chain

of perfluorinated monomers containing at least one of a sulfonic acid group or a

carboxylic acid group.

50. (Original) The electrochemical gas sensor as defined in claim 48, wherein one of the

first and second electrical conductor materials for said at least one of the sensing, counter,

first pump, and second pump electrodes is about 50-99 wt % of carbon black, and the

other of the first and second electrical conductor materials for said at least one of the

sensing, counter, first pump and second pump electrodes is about 1-50 wt % of platinum.

51. (Original) The electrochemical gas sensor as defined in claim 48, wherein one of the

first and second electrical conductor materials for said at least one of the sensing, counter,

first pump, and second pump electrodes is about 50-99 wt % of carbon black, and the

other of the first and second electrical conductor materials for said at least one of the

sensing, counter, first pump, and second pump electrodes is about 1-50 wt % of Ru oxide.

52. (Original) An electrochemical gas sensor for quantitative measurement of a gas in an

ambient atmosphere comprising:

a sensing electrode permeable to water vapor and comprised of an electrical

conducting material and being exposed to the ambient atmosphere;

Response to Office Action USSN 10/621,637 & 90/006,209 Page 18 of 68

a reference electrode permeable to water vapor and comprised of an electrical

conducting material;

a counter electrode permeable to water vapor and comprised of an electrical

conducting material and being separate from both said sensing and reference electrodes,

and being exposed to the ambient atmosphere;

a protonic conductive electrolyte membrane permeable to water vapor, having top

and bottom sides, said bottom side of said protonic conductive membrane being in

contact with the counter electrode, and the top side of said protonic conductive membrane

being in contact with the sensing and reference electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter

electrode to said water vapor, the sensing electrode reacting with the gas to produce a

change in electrical characteristic between the sensing electrode and the counter

electrode; and

means for electrical measurement in electrical contact between the sensing

electrode and the counter electrode, wherein the electrical conducting material of at least

one of said sensing, counter, and reference electrodes is a proton-electron mixed

conductive material having 10-50 wt % of a proton conductor material and 50-90 wt % of

a first and a second electrical conductor material;

whereby, in a positive ambient concentration of said gas, said electrical measurement

means detects changes in said electrical characteristic.

53. (Original) The electrochemical gas sensor as defined in claim 52, further comprising:

means for applying a DC power across said protonic electrolyte membrane in

electrical contact between the sensing electrode and said counter electrode, whereby the

gas is transported away from the counter electrode when the DC power means applies a

DC power across said protonic electrolyte membrane.

54. (Original) The electrochemical gas sensor as defined in claim 52, wherein said means

for exposing a surface of said counter electrode to said water vapor further contains an

antifreeze additive.

Response to Office Action USSN 10/621,637 & 90/006,209 Page 19 of 68

55. (Original) The electrochemical gas sensor as defined in claim 52, wherein the surface

of said sensing electrode that is exposed to the ambient atmosphere has a surface area

smaller than the surface area of the surface of the counter electrode that is exposed to said

water vapor, whereby the first protonic conductive electrolyte membrane is exposed to

substantially 100 percent relative humidity, and a positive pressure of said water vapor

exists from the surface of said counter electrode that is exposed to said water vapor to the

surface of said sensing electrode that is exposed to the ambient atmosphere.

56. (Original) The electrochemical gas sensor as defined in claim 55, wherein the surface

area of the surface of the counter electrode that is exposed to said water vapor is

separated from said means for exposing a surface of said counter electrode to said water

vapor by a hydrophobic membrane permeable to water vapor and substantially

impervious to water.

57. (Original) The electrochemical gas sensor as defined in claim 52, wherein at least one

of the surfaces of said protonic conductive electrolyte membrane in contact with one of

the sensing, counter, and reference electrodes is substantially nonplanar.

58. (Original) The electrochemical gas sensor as defined in claim 52, wherein at least one

of the sensing, counter, and reference electrodes is comprised of film having a thickness

in the range of about 50 Angstroms to 10,000 Angstroms.

59. (Original) The electrochemical gas sensor as defined in claim 58, wherein the film is

substantially composed of a noble metal.

60. (Original) The electrochemical gas sensor as defined in claim 59, wherein the noble

metal is platinum.

61. (Original) The electrochemical gas sensor as defined in claim 52, wherein the

Response to Office Action USSN 10/621,637 & 90/006,209 Page 20 of 68

protonic conductive electrolyte membrane is substantially comprised of a solid,

perfluorinated, ion-exchange polymer.

62. (Original) The electrochemical gas sensor as defined in claim 52, wherein the

protonic conductive electrolyte membrane is a hydrated metal oxide protonic conductor

electrolyte membrane.

63. (Original) The electrochemical gas sensor as defined in claim 52, wherein the proton

conductor material for said at least one of the sensing, counter, and reference electrodes is

a copolymer having a tetrafluoroethylene backbone with a side chain of perfluorinated

monomers containing at least one of a sulfonic acid group or a carboxylic acid group.

64. (Original) The electrochemical gas sensor as defined in claim 52, wherein one of the

first and second electrical conductor materials for said at least one of the sensing, counter,

and reference electrodes is about 50-99 wt % of carbon black, and the other of the first

and second electrical conductor materials for said at least one of the sensing, counter, and

reference electrodes is about 1-50 wt % of platinum.

65. (Original) The electrochemical gas sensor as defined in claim 52, wherein one of the

first and second electrical conductor materials for said at least one of the sensing, counter,

and reference electrodes is about 50-99 wt % of carbon black, and the other of the first

and second electrical conductor materials for said at least one of the sensing, counter, and

reference electrodes is about 1-50 wt % of Ru oxide.

Claim 66. (Previously Presented) A two-electrode electrochemical gas sensor for measurement of a gas in an ambient atmosphere comprising:

- a sensing electrode permeable to water vapor and comprised of an electrical conducting material and having a surface exposed to the ambient atmosphere;
- <u>a counter electrode permeable to water vapor and comprised of an electrical</u> <u>conducting material</u>;
- a first protonic conductive electrolyte membrane permeable to water vapor and situated between and in contact with the sensing and counter electrodes, the sensing electrode and the counter electrode being the only two electrodes in contact with the first protonic conductive electrolyte membrane and the sensing electrode reacting with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode;

means for electrical measurement electrically connected to said sensing and counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a proton conductor material and 50-90 wt % of a first and a second electrical conductor material;

whereby, in a positive ambient atmosphere concentration of said gas, said electrical measurement means detects changes in said electrical characteristic.

- Claim 67. (Previously Presented) An electrochemical gas sensor for measurement of a gas in an ambient atmosphere comprising:
- a sensing electrode permeable to water vapor and comprised of an electrical conducting material and having a surface exposed to the ambient atmosphere;
- a counter electrode permeable to water vapor and comprised of an electrical conducting material;
- a first protonic conductive electrolyte membrane permeable to water vapor and situated between and in contact with the sensing and counter electrodes, the sensing

electrode reacting with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode in the absence of an applied voltage to the sensing electrode;

means for electrical measurement electrically connected to said sensing and counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a proton conductor material and 50-90 wt % of a first and a second electrical conductor material;

whereby, in a positive ambient atmosphere concentration of said gas, said electrical measurement means detects changes in said electrical characteristic.

Claim 68. (Cancelled)

Claim 69. (Cancelled)

Claim 70. (Previously Presented) The electrochemical gas sensor of claim 77 in which the sensing electrode and the counter electrode are the only two electrodes in contact with the first protonic conductive electrolyte membrane.

Claim 71. (Previously Presented) The electrochemical gas sensor of claim 77 in which the sensing electrode reacts with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode in the absence of an applied voltage to the sensing electrode.

Claim 72. (Previously Presented) The electrochemical gas sensor of claim 70 in which the sensing electrode reacts with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode in the absence of an applied voltage to the sensing electrode.

Claim 73. (Currently Amended) A non-biased electrochemical gas sensor for measurement of a gas in an ambient atmosphere comprising:

a sensing electrode permeable to water vapor and comprised of an electrical conducting material and having a surface exposed to the ambient atmosphere;

a counter electrode permeable to water vapor and comprised of an electrical conducting material;

a first protonic conductive electrolyte membrane permeable to water vapor and situated between and in contact with the sensing and counter electrodes, the sensing electrode reacting with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode;

means for electrical measurement electrically connected to said sensing and counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a proton conductor material and 50-90 wt % of a first and a second electrical conductor material;

whereby, in a positive ambient atmosphere concentration of said gas, said electrical measurement means detects changes in said electrical characteristic in the absence of any biasing voltage.

Claim 74. (Previously Presented) The non-biased electrochemical gas sensor of claim 73 in which the sensing electrode and the counter electrode are the only two electrodes in contact with the first protonic conductive electrolyte membrane.

Claim 75. (Previously Presented) The non-biased electrochemical gas sensor of claim 73 in which the sensing electrode reacts with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode in the absence of an applied voltage to the sensing electrode.

<u>Claim 76. (Previously Presented)</u> A two-electrode electrochemical gas sensor for measurement of a gas in an ambient atmosphere comprising:

a sensing electrode permeable to water vapor and comprised of an electrical conducting material and having a surface exposed to the ambient atmosphere;

a counter electrode permeable to water vapor and comprised of an electrical conducting material;

a first protonic conductive electrolyte membrane permeable to water vapor and situated between and in contact with the sensing and counter electrodes, the sensing electrode and the counter electrode being the only two electrodes in contact with the first protonic conductive electrolyte membrane, and the sensing electrode reacting with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode in the absence of an applied voltage to the sensing electrode;

means for electrical measurement electrically connected to said sensing and counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a proton conductor material and 50-90 wt % of a first and a second electrical conductor material;

whereby, in a positive ambient atmosphere concentration of said gas, said electrical measurement means detects changes in said electrical characteristic.

Claim 77. (Currently Amended) An electrochemical gas sensor for measurement of a gas in an ambient atmosphere comprising:

<u>a sensing electrode permeable to water vapor and comprised of an electrical</u> <u>conducting material and having a surface exposed to the ambient atmosphere;</u>

a counter electrode permeable to water vapor and comprised of an electrical conducting material;

a first protonic conductive electrolyte membrane permeable to water vapor and situated between and in contact with the sensing and counter electrodes, the sensing electrode reacting with the gas to produce a change in electrical characteristic between

the sensing electrode and the counter electrode, the sensing electrode and the counter

electrode being on opposite sides of the first protonic conductive electrolyte membrane;

means for electrical measurement electrically connected to said sensing and counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a proton conductor material and 50-90 wt % of a first and a second electrical conductor material;

whereby, in a positive ambient atmosphere concentration of said gas, said electrical measurement means detects changes in said electrical characteristic.

<u>Claim 78. (Previously Presented)</u> An electrochemical gas sensor for quantitative measurement of a gas in an ambient atmosphere at room temperature comprising:

<u>a sensing electrode permeable to water vapor and comprised of an electrical</u> <u>conducting material and having a surface exposed to the ambient atmosphere;</u>

a counter electrode permeable to water vapor and comprised of an electrical conducting material;

a first protonic conductive electrolyte membrane permeable to water vapor and situated between and in contact with the sensing and counter electrodes, the sensing electrode being capable of reacting with the gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode;

means for electrical measurement electrically connected to said sensing and counter electrodes, said means for electrical measurement being capable of detecting changes in said electrical characteristic in a positive ambient atmosphere concentration of said gas;

means, containing a volume of water vapor, for exposing a surface of said counter

electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and

counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a

proton conductor material and 50-90 wt % of a first and a second electrical conductor

material.

Claim 79. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein said water vapor containing means contains a volume of water and an

antifreeze additive.

Claim 80. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the surface of said sensing electrode that is exposed to the ambient

atmosphere has a surface area that is smaller than the surface area of the surface of the

counter electrode that is exposed to said water vapor, whereby the first protonic

conductive electrolyte membrane is exposed to substantially 100 percent relative

humidity, and a positive pressure of said water vapor exists from the surface of said

counter electrode exposed to said water vapor to the surface of said sensing electrode

exposed to the ambient atmosphere.

Claim 81. (Previously Presented) The electrochemical gas sensor as defined in claim

80, wherein the surface area of the surface of the counter electrode that is exposed to said

water vapor is separated from said means for exposing a surface of said counter electrode

to said water vapor by a hydrophobic membrane permeable to water vapor and

substantially impervious to water.

Claim 82. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the first protonic conductive electrolyte membrane has opposing surfaces,

each of said opposing surfaces being in contact with one of the sensing and counter

electrodes, wherein at least one of the opposing surfaces of said first protonic conductive

Response to Office Action USSN 10/621,637 & 90/006,209 Page 27 of 68

electrolyte membrane in contact with one of the sensing and counter electrodes is

substantially nonplanar.

Claim 83. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein at least one of the sensing and counter electrodes is comprised of film having

a thickness in the range of about 50 Angstroms to 10,000 Angstroms.

<u>Claim 84. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

83, wherein the film is substantially composed of a noble metal.

<u>Claim 85. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

84, wherein the noble metal is platinum.

<u>Claim 86. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

78, wherein the first protonic conductive electrolyte membrane is substantially composed

of a solid, perfluorinated, ion-exchange polymer.

<u>Claim 87. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

78, wherein the first protonic conductive electrolyte membrane is a hydrated metal oxide

protonic conductor electrolyte membrane.

<u>Claim 88. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

78, wherein the proton conductor material for said at least one of the sensing and counter

electrodes is a copolymer having a tetrafluoroethylene backbone with a side chain of

perfluorinated monomers containing at least one of a sulfonic acid group or a carboxylic

acid group.

Claim 89. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein one of the first and second electrical conductor materials for said at least one

of the sensing and counter electrodes is about 50-99 wt % of carbon black, and the other

Response to Office Action USSN 10/621,637 & 90/006,209 Page 28 of 68

of the first and second electrical conductor materials for said at least one of the sensing

and counter electrodes is about 1-50 wt % of platinum.

<u>Claim 90. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

78, wherein one of the first and second electrical conductor materials for said at least one

of the sensing and counter electrodes is about 50-99 wt % of carbon black, and the other

of the first and second electrical conductor materials for said at least one of the sensing

and counter electrodes is about 1-50 wt % of Ru oxide.

Claim 91. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the electrochemical gas sensor further comprises:

first and second pump electrodes comprised of an electrical conducting material

permeable to water vapor, separate from said sensing and counter electrodes, and situated

on opposite sides of and in contact with said first protonic conductive electrolyte

membrane, said second pump electrode being situated on the same side of said first

protonic conductive membrane as the counter electrode and having a surface thereon

exposed to the water vapor in said means for exposing a surface of said counter electrode

to said water vapor; and means for applying a DC power across the first protonic

conductive electrolyte membrane, said first and second pump electrodes having in

electrical connection therebetween said means for applying DC power across the first

protonic conductive electrolyte membrane;

whereby the gas is transported away from the counter electrode when the DC

power means applies a DC power to the first and second pump electrodes.

Claim 92. (Previously Presented) The electrochemical gas sensor of claim 91,

wherein the electrical conducting material of the first and second pump electrodes is

substantially composed of carbon.

Claim 93. (Previously Presented) The electrochemical gas sensor as defined in claim

91, wherein the electrical conducting material of the first and second pump electrodes is

substantially composed of noble metals.

Response to Office Action USSN 10/621,637 & 90/006,209 Page 29 of 68

Claim 94. (Previously Presented) The electrochemical gas sensor as defined in claim

91, wherein the electrical conducting material of the first and second pump electrodes is

substantially composed of conductive hydrated metal oxides.

<u>Claim 95. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

91, wherein at least one of the first and second pump electrodes is comprised of a film

having a thickness in the range of about 50 Angstroms to 10,000 Angstroms.

Claim 96. (Previously Presented) The electrochemical gas sensor as defined in claim

91, wherein the electrical conducting material of said first and second pump electrodes is

a proton-electron mixed conductive material having 10-50 wt % of a proton conductor

material and 50-90 wt % of a first and a second electrical conductor material.

Claim 97. (Previously Presented) The electrochemical gas sensor as defined in claim

96, wherein the proton conductor material for both the first and second pump electrodes

is a copolymer having a tetrafluoroethylene backbone with a side chain of perfluorinated

monomers containing at least one of a sulfonic acid group or a carboxylic acid group.

Claim 98. (Previously Presented) The electrochemical gas sensor as defined in claim

96, wherein one of the first and second electrical conductor materials for the first pump

electrode is about 50-99 wt % of carbon black, and the other of the first and second

electrical conductor materials for the first pump electrode is 1 to 50 wt % of platinum.

Claim 99. (Previously Presented) The electrochemical gas sensor as defined in claim

96, wherein one of the first and second electrical conductor materials for the second

pump electrode is about 50-99 wt % of carbon black, and the other of the first and second

electrical conductor materials for the second pump electrode is 1 to 50 wt % of Ru oxide.

Claim 100. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the electrochemical gas sensor further comprises:

Response to Office Action USSN 10/621,637 & 90/006,209 Page 30 of 68

a second protonic conductive electrolyte membrane permeable to water vapor;

first and second pump electrodes permeable to water vapor and comprised of an electron conductive material, and being separate from said sensing and counter electrodes and situated on opposite sides of and in contact with said second protonic conductive electrolyte membrane, said means for exposing a surface of said counter electrode to said water vapor exposing a surface of said second pump electrode to said water vapor, and said first pump electrode having a surface exposed to the ambient atmosphere; and

means for applying a DC power across said second protonic electrolyte membrane, said first and second pump electrodes having in electrical connection therebetween said means for applying DC power across said second protonic electrolyte membrane;

whereby the gas is transported away from the counter electrode when the DC power means applies a DC power to the first and second pump electrodes.

Claim 101. (Previously Presented) The electrochemical gas sensor as defined in claim 100, wherein the second protonic conductive electrolyte membrane is substantially composed of a solid, perfluorinated, ion-exchange polymer.

Claim 102. (Previously Presented) The electrochemical gas sensor as defined in claim 100, wherein the second protonic conductive electrolyte membrane is a hydrated metal oxide protonic conductor electrolyte membrane.

Claim 103. (Previously Presented) The electrochemical gas sensor as defined in claim 100, wherein the surface area of the surface of said first pump electrode that is exposed to the ambient atmosphere is smaller than the surface area of the surface of the second pump electrode that is exposed to said water vapor, whereby the second protonic conductive electrolyte membrane is exposed to substantially 100 percent relative humidity, and a positive pressure of said water vapor exists from the surface of said second pump electrode that is exposed to said water vapor to the surface of said first pump electrode that is exposed to the ambient atmosphere.

Claim 104. (Previously Presented) The electrochemical gas sensor as defined in claim

103, wherein the surface area of the surface of the second pump electrode that is exposed

to said water vapor is separated from said means for exposing a surface of said counter

electrode to said water vapor by a hydrophobic membrane permeable to water vapor and

substantially impervious to water.

Claim 105. (Previously Presented) The electrochemical gas sensor as defined in claim

78, further comprising:

means for applying a DC pulse power source across the first protonic conductive

membrane, said sensing and counter electrodes having in electrical connection

therebetween said means for applying DC pulse power across the first protonic

conductive membrane; and

switch means for alternating the connection between the sensing and counter

electrodes from the electrical measurement means to the DC pulse power means;

whereby, in a positive ambient atmosphere concentration of said gas, said

electrical measurement means detects changes in said electrical characteristic when said

switch means connects said electrical measurement means to the sensing and counter

electrodes; and

whereby said DC pulse power means moves the gas away from a side of the gas

sensor where the counter electrode is placed when said switch means connects said DC

pulse power means to the sensing and counter electrodes.

Claim 106. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the gas is CO.

Claim 107. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the gas is  $NO_x$ .

<u>Claim 108. (Previously Presented)</u> The electrochemical gas sensor as defined in claim

78, wherein the gas is hydrogen.

Response to Office Action USSN 10/621,637 & 90/006,209

Claim 109. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the gas is  $H_2S$ .

Claim 110. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the gas is  $H_2O$  vapor.

Claim 111. (Previously Presented) The electrochemical gas sensor as defined in claim

78, wherein the gas is alcohol vapor.

Claim 112. (Previously Presented) An electrochemical gas sensor for quantitative

measurement of a gas in an ambient atmosphere at room temperature comprising:

a sensing electrode permeable to water vapor and comprised of an electrical

conducting material and being exposed to the ambient atmosphere;

a reference electrode permeable to water vapor and comprised of an electrical

conducting material;

a counter electrode permeable to water vapor and comprised of an electrical

conducting material and being separate from both said sensing and reference electrodes,

and being exposed to the ambient atmosphere;

a protonic conductive electrolyte membrane permeable to water vapor, having top

and bottom sides, said bottom side of said protonic conductive membrane being in

contact with the counter electrode, and the top side of said protonic conductive membrane

being in contact with the sensing and reference electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter

electrode to said water vapor, the sensing electrode being capable of reacting with the gas

to produce a change in electrical characteristic between the sensing electrode and the

counter electrode; and

means for electrical measurement in electrical contact between the sensing

electrode and the counter electrode,

wherein the electrical conducting material of at least one of said sensing, counter,

and reference electrodes is a proton-electron mixed conductive material having 10-50 wt

Response to Office Action USSN 10/621,637 & 90/006,209 Page 33 of 68

% of a proton conductor material and 50-90 wt % of a first and a second electrical

conductor material;

whereby, in a positive ambient concentration of said gas, said electrical

measurement means is capable of detecting changes in said electrical characteristic.

Claim 113. (Previously Presented) The electrochemical gas sensor as defined in claim

112, further comprising:

means for applying a DC power across said protonic electrolyte membrane in

electrical contact between the sensing electrode and said counter electrode, whereby the

gas is transported away from the counter electrode when the DC power means applies a

DC power across said protonic electrolyte membrane.

Claim 114. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein said means for exposing a surface of said counter electrode to said water

vapor further contains an antifreeze additive.

Claim 115. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein the surface of said sensing electrode that is exposed to the ambient

atmosphere has a surface area smaller than the surface area of the surface of the counter

electrode that is exposed to said water vapor, whereby the first protonic conductive

electrolyte membrane is exposed to substantially 100 percent relative humidity, and a

positive pressure of said water vapor exists from the surface of said counter electrode that

is exposed to said water vapor to the surface of said sensing electrode that is exposed to

the ambient atmosphere.

Claim 116. (Previously Presented) The electrochemical gas sensor as defined in claim

115, wherein the surface area of the surface of the counter electrode that is exposed to

said water vapor is separated from said means for exposing a surface of said counter

electrode to said water vapor by a hydrophobic membrane permeable to water vapor and

substantially impervious to water.

Response to Office Action USSN 10/621,637 & 90/006,209 Page 34 of 68

Claim 117. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein at least one of the surfaces of said protonic conductive electrolyte

membrane in contact with one of the sensing, counter, and reference electrodes is

substantially nonplanar.

Claim 118. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein at least one of the sensing, counter, and reference electrodes is comprised of

film having a thickness in the range of about 50 Angstroms to 10,000 Angstroms.

Claim 119. (Previously Presented) The electrochemical gas sensor as defined in claim

118, wherein the film is substantially composed of a noble metal.

Claim 120. (Previously Presented) The electrochemical gas sensor as defined in claim

119, wherein the noble metal is platinum.

Claim 121. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein the protonic conductive electrolyte membrane is substantially comprised of

a solid, perfluorinated, ion-exchange polymer.

Claim 122. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein the protonic conductive electrolyte membrane is a hydrated metal oxide

protonic conductor electrolyte membrane.

Claim 123. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein the proton conductor material for said at least one of the sensing, counter,

and reference electrodes is a copolymer having a tetrafluoroethylene backbone with a

side chain of perfluorinated monomers containing at least one of a sulfonic acid group or

a carboxylic acid group.

Claim 124. (Previously Presented) The electrochemical gas sensor as defined in claim

Response to Office Action USSN 10/621,637 & 90/006,209 Page 35 of 68

112, wherein one of the first and second electrical conductor materials for said at least one of the sensing, counter, and reference electrodes is about 50-99 wt % of carbon black, and the other of the first and second electrical conductor materials for said at least one of

the sensing, counter, and reference electrodes is about 1-50 wt % of platinum.

Claim 125. (Previously Presented) The electrochemical gas sensor as defined in claim

112, wherein one of the first and second electrical conductor materials for said at least

one of the sensing, counter, and reference electrodes is about 50-99 wt % of carbon black,

and the other of the first and second electrical conductor materials for said at least one of

the sensing, counter, and reference electrodes is about 1-50 wt % of Ru oxide.

Claim 126. (Previously Presented) A residential electrochemical gas sensor for

quantitative measurement of carbon monoxide gas in an ambient atmosphere comprising:

a sensing electrode permeable to water vapor and comprised of an electrical

conducting material and having a surface exposed to the ambient atmosphere;

a counter electrode permeable to water vapor and comprised of an electrical

conducting material;

a first protonic conductive electrolyte membrane permeable to water vapor and

situated between and in contact with the sensing and counter electrodes, the sensing

electrode being capable of reacting with the carbon monoxide gas to produce a change in

electrical characteristic between the sensing electrode and the counter electrode;

means for electrical measurement electrically connected to said sensing and

counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter

electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and

counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a

proton conductor material and 50-90 wt % of a first and a second electrical conductor

material;

whereby, in a positive ambient atmosphere concentration of the carbon monoxide gas at room temperature, said electrical measurement means is capable of detecting changes in said electrical characteristic.

<u>Claim 127. (Previously Presented)</u> The electrochemical gas sensor of claim 126 in which the sensing electrode comprises a mixed protonic-electronic conductive electrode.

Claim 128. (New) A two-electrode residential electrochemical gas sensor for quantitative measurement of carbon monoxide gas in an ambient atmosphere comprising:

a sensing electrode permeable to water vapor and comprised of an electrical conducting material and having a surface exposed to the ambient atmosphere;

a counter electrode permeable to water vapor and comprised of an electrical conducting material:

a first protonic conductive electrolyte membrane permeable to water vapor and situated between and in contact with the sensing and counter electrodes, the sensing electrode and the counter electrode being the only two electrodes in contact with the first protonic conductive electrolyte membrane, and the sensing electrode reacting with the carbon monoxide gas to produce a change in electrical characteristic between the sensing electrode and the counter electrode in the absence of an applied voltage to the sensing electrode;

means for electrical measurement electrically connected to said sensing and counter electrodes;

means, containing a volume of water vapor, for exposing a surface of said counter electrode to said water vapor,

wherein the electrical conducting material of at least one of said sensing and counter electrodes is a proton-electron mixed conductive material having 10-50 wt % of a proton conductor material and 50-90 wt % of a first and a second electrical conductor material;

whereby, in a positive ambient atmosphere concentration of the carbon monoxide

gas at room temperature, said electrical measurement means detects changes in said

electrical characteristic;

wherein each of the sensing electrode and the counter electrode comprise a mixed

protonic-electronic conductive electrode including platinum, carbon and a copolymer

having a tetrafluorethylene backbone with a side chain of perfluorinated monomers

containing a sulfonic acid group; and

wherein the protonic conductive solid electrolyte membrane is substantially

comprised of a solid, perfluorinated, ion-exchange polymer.

129. (New) The two-electrode electrochemical gas sensor as defined in claim 128,

wherein the sensing and counter electrodes have a diameter in a range of 1 mm to 15 mm,

and the protonic conductive electrolyte membrane has a thickness in a range of 0.1 mm to

<u>1 mm.</u>

130. (New) The two-electrode electrochemical gas sensor as defined in claim 128,

wherein the sensing and counter electrodes have a diameter of about 15 mm, and the

protonic conductive electrolyte membrane has a thickness of about 0.17 mm.

131. (New) The two-electrode electrochemical gas sensor as defined in claim 128,

wherein the electrical conducting material of at least one of said sensing and counter

electrodes is a proton-electron mixed conductive material having at least approximately

25 wt % of a proton conductor material.

132. (New) The two-electrode electrochemical gas sensor as defined in claim 128,

wherein said counter electrode is exposed to said water vapor at a 100% relative

humidity.
